

Question:

My outdoor unit unit starts, then stops almost immediately yet the cooling signal is still present. What is the problem?

Check resistors R25 and R258 on the outdoor PCB.

These should be smaller in physical size than resistors R26, R27, R28, R268, R278 and R288. The body of resistors R25 and R258 should be beige in colour with bands of: Blue, Grey and Orange on one resistor and Yellow, Violet and Orange on the other. It is of no consequence which of these resistors is installed as R25 and which as R258.
